**Figure 1** Primary brain tumors, that kind from cells inside the brain, could also be malignant (cancerous) or benign (non-cancerous). However, even benign tumors will injury traditional brain tissue and cause serious issues. Benign tumors grow slowly and have a tendency to be a lot of amendable to surgical or different treatments. Malignant brain tumors area unit a lot of aggressive and grow quicker. When cancer develops elsewhere within the body and spreads to the brain, it's known as a secondary tumour, or brain metastasis. carcinoma, carcinoma, excretory organ willcer and carcinoma can all metastasise to the brain. These tumors area unit a lot of common than primary brain tumors. Treatment for brain tumors depends on variety of things as well as the kind, location and size of the tumour further because the patient's age and general health. Treatment strategies and schedules dissent for kids and adults. Brain tumors area unit treated with surgery, irradiation and therapy. Our doctors are also learning a immunogen for treating a repeated cancer of the central systema nervosum that happens primarily within the brain, called brain tumour.
